P J Potter Power Plant Theory Designzip (1) The roof and wall materials have to be suitable for the pressure of the column. (2) Usually, three types of pressure are used, viz. (a) For basic-type buildings, the pressure differential can be 2 to 3 times that of wind pressure. (b) Intermediate-type buildings have differential pressures of about 8 to 15 times that of wind pressure. (c) Wind pressure is used in super-pressurized buildings. (3) The cost of roofing depends on the roofing material used and the type of the building. Water is formed in water formations, which occur as natural underground brines or as natural underground water bodies, subterranean geological structures, and surface formations such as lakes, rivers, dams, dam beds, ponds, swamps, and septic systems. The most common source of water for drinking and human consumption is groundwater. Groundwater is found in an underground network of porous rock and soil; these ground structures are often called aquifers. Groundwater comes to the surface via natural processes, as the water table rises. The main sources of water for irrigation are precipitation, as in a rain shower, and groundwater. The primary sources of industrial water are precipitation and groundwater. Irrigation, an irrigation system to provide water to crops, is the most widespread use of groundwater. Groundwater can contaminate agricultural land because of over-exposure. A well-bore, also called a vertical shaft, is a hole dug down to the water table. Its depth is determined by the depth of the water table. A well-bore is usually installed for either of two reasons: for a supply of water for drinking or for irrigation. In both cases, an artificial supply is needed because no naturally occurring water is available at that depth. There are two types of well-bores: vertical and horizontal. In a vertical well-bore, the shaft is vertical (though sometimes leaning in a direction away from the natural water table) and is usually straight in shape. The shaft may be several thousand feet (fathoms) deep and need to extend great distances to reach the water. All of these factors contribute to the significant amount of construction material and time needed. The point at which the vertical well-bore intersects the water table may be determined by using simple water-level measurements. If this does not work, a vertical well-bore may be used. Hyd
